ART UNIT

PAPER NUMBER

2189

DATE MAILED: 10/13/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)	
	10/734,690	ARCHAMBAULT ET AL.	
	Examiner	Art Unit	
	Shawn Gu	2189	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 18 September 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1 and 3-31 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1 and 3-31 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Amendment

1. This non-final Office action is in response to the amendment filed on 18 September 2006. Claims 1 and 3-31 are pending. Claim 2 is cancelled. All objections and rejections not repeated below are withdrawn.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –
(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1, 4-12, 14-25 and 29-31 are rejected under 35 U.S.C. 102(b) as being anticipated by Long et al. [US 2002/0129079 A1] (hereinafter "Long").

Per claims 1, 11 and 24, Long teaches a runtime system (see Fig 7) that scales to a plurality of processors (CPUs 1032, see Fig 6, and Pg. 5, Para. [0056]) for a global address space language program (Java, see Pg. 5, Para. [0058] and Pg. 6, Para. [0062]), having a plurality of threads (Threads 1-N 104, see Fig 1 and Pg. 1, Para. [0009]) that access memory in a global address space system, the system comprising:

Art Unit: 2189

a shared data directory (combination of Pool 110 of Shared Object 108 and Shared Freelist 112, see Fig 1 and Pg. 1, Para. [0009]), for locating and managing shared objects (the shared Freelist 112 is either by itself or in combination with other component used for locating and managing the shared objects 108 and the shared monitors 106), the directory maintaining shared data entries (Monitors 116, see Figs. 1, 2a-2b, 3a-3c) related to shared data structures (Shared Objects 108, see Figs. 1, 2a-2b, 3a-3c) that are shared by more than one of the plurality of threads; and

control structures (combination of Garbage Collector, the methods and apparatus to associate monitors and objects, and memory management in Java and Titanium, see Pg. 2, Para. [0014] and [0020], Pg. 3, Para. [0040]-[0042], and Figs. 1, 2a-2b, 3a-3c, 4, 5a-5c) to access, allocate and de-allocate the shared data structures through the shared data directory.

It is clear the runtime system of claim 1 is already described by claim 11, and the method of claim 24 is performed by the runtime system of claim 11 and claim 1.

Per claims 4, 12 and 29, Long further teaches the runtime system is implemented on a shared memory system and the directory of shared variables is stored in a shared memory shared by all threads (Primary Storage/RAM 1034, see Fig. 6 and Pg.5, Para. [0055]).

Per claim 5, Long further teaches the allocation and de-allocation routines are used for both statically and dynamically allocated data (static class variables in Java

and dynamic objects such as arrays are all allocated and de-allocated using the control structure described above).

Per claims 6 and 14, Long further teaches arrays that are dynamically allocated have affinity to a thread that called the allocation or de-allocation routine (arrays in Java are created dynamically, and a thread type class object that created the array obtains the monitor to access the array).

Per claims 7 and 8, Long further teaches every thread has a handle for each shared variable that it accesses, and the entries in the directory of shared variables area accessed using the handle (Java threads have handling methods to access objects, which include Object Pointers 310 and Monitor Pointers 314, see Figs. 3a-3c).

Per claims 9 and 21, Long further teaches the handle comprises a partition index (Monitor Pointer 314, see Figs. 3a-3c) and a variable index (Object Pointer 310, see Figs. 3a-3b).

Per claims 10 and 23, Long further teaches each thread has exclusive write access rights to a partition and uses a mutually exclusive partition of the shared data directory (monitors that are associated with objects that are locked by a particular thread is mutually exclusive to other threads, see Pg. 3, Para. [0040]-[0042], Pg.4, Para.[0042]-[0047]).

Per claim 15, Long further teaches the shared data structures comprise shared scalar variables (provided by Java), objects (Objects, see Fig. 2a-2b, Fig. 3a-3b), arrays (provided by Java) or pointers (provided by Java).

Per claim 16, Long further teaches that a shared scalar variable is accessed by dereferencing a shared data directory partition for which the shared scalar variable has affinity (Object Pointers 310 to shared objects that are Java scalar variable type objects, see Fig. 3a-3b).

Per claim 17, Long further teaches a shared array has a shared data directory partition that points to a control structure that points to the shared array (Java array type objects are accessed through pointers, which are part of the control structure described above in claim 11).

Per claim 18, Long further teaches the runtime system allocates a controller harness for a shared pointer when the shared pointer is declared by allocating a shared control block and a shared address structure (monitors implemented in Java for pointer type objects in the shared directory described above).

Per claim 19, Long further teaches some of the shared pointers have shared targets and some of the shared pointers have private targets (the targets are the

Art Unit: 2189

monitors, which maybe global (shared) or thread-based (private), see Pg. 1, Para. [0009]).

Per claims 20 and 30, Long further teaches entries to the shared data directory are allocated by an owning thread or, in a synchronized manner by all threads at the same time (monitors implemented in Java handle allocation of objects shared by threads, see Pg. 2, Para. [0014], Pg. 3, Para. [0040]-[0042], Pg.4, Para.[0042]-[0047]), and the owning/calling thread inserts a handle in a partition in the directory of shared variables (a thread acquires/sets lock of monitor for the shared object, see Pg. 2, Para. [0014], Pg. 3, Para. [0040]-[0042], Pg.4, Para.[0042]-[0047]).

Per claim 22, Long further teaches the shared data directory includes a partition that is used to access all statically declared non-scalar variables (the group of monitors that are all used to handle sharing of objects that contain Java static class variables which are non-scalar).

Per claim 25, Long furthers teaches creating control structures comprises creating a plurality of control structures wherein each control structure controls the allocation and de-allocation of a particular type of shared data structure (in Java and other object oriented programming languages, memory allocation and de-allocation of different types of objects are implemented differently, since different types of objects use memory differently).

Per claim 31, Long further teaches the control structures are common such that any thread can access the common control structures (a shared memory machine implies common control structure, as Java's compiled byte codes and the runtime environment must be present in the shared memory, see Fig 7).

4. Claims 3, 13, 26-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Long in further view of Tanenbaum et al. [Distributed Systems: Principles and Paradigms] (hereinafter "Tanenbaum").

Per claims 3, 13, 26 and 27, Long does not particularly disclose that the runtime system is implemented on a distributed memory system and the directory of shared variables is stored in a private memory of each thread such that it is replicated across all of the threads. However, Tanenbaum teaches that a distributed memory system (see Tanenbaum, Pg. 16, Fig. 1-6, Private Memory), provides fault-tolerance and increased storage and processing capabilities of the processing system (Reasons for Replication, see Pg. 292-293). Tanenbaum further teaches that full-replication of shared data provides further fault-tolerance (full replication ensures that as long as one copy is still available, operations on the shared data can still be performed, see Pg.292-293). Therefore it would have been obvious to one ordinarily skilled in the art at the time of the Applicant's invention to implement the runtime system on a distributed

Art Unit: 2189

memory system, and replicated the shared directory across all threads' private memories, for the reasons described above.

Per claim 28, Long further teaches each thread has a private data control structure (Lock, Wait, and Unlock, see Fig 3a-3c) with a pointer (Pointer 310 and Point 314, see Fig 3a-3c) to a shared memory fraction.

Response to Arguments

5. Applicant's arguments with respect to claims 1 and 3-31 have been considered but are moot in view of the new ground(s) of rejection. The newly added limitations are taught by Long [US 2002/0129079 A1], in further view of Tanenbaum et al., as set forth above. This Office action is not made final as the Examiner changed the grounds of rejection.

Art Unit: 2189

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Shawn Gu whose telephone number is (571) 272-0703. The examiner can normally be reached on 9am-5pm, Monday through Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Reginald Bragdon can be reached on (571) 272-4204. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
